Reactor pressure monitoring

Fictional sample data: cooling reduces reactor pressure from 120 kPa to 80 kPa.
The reactor pressure chart compares readings before and after cooling.

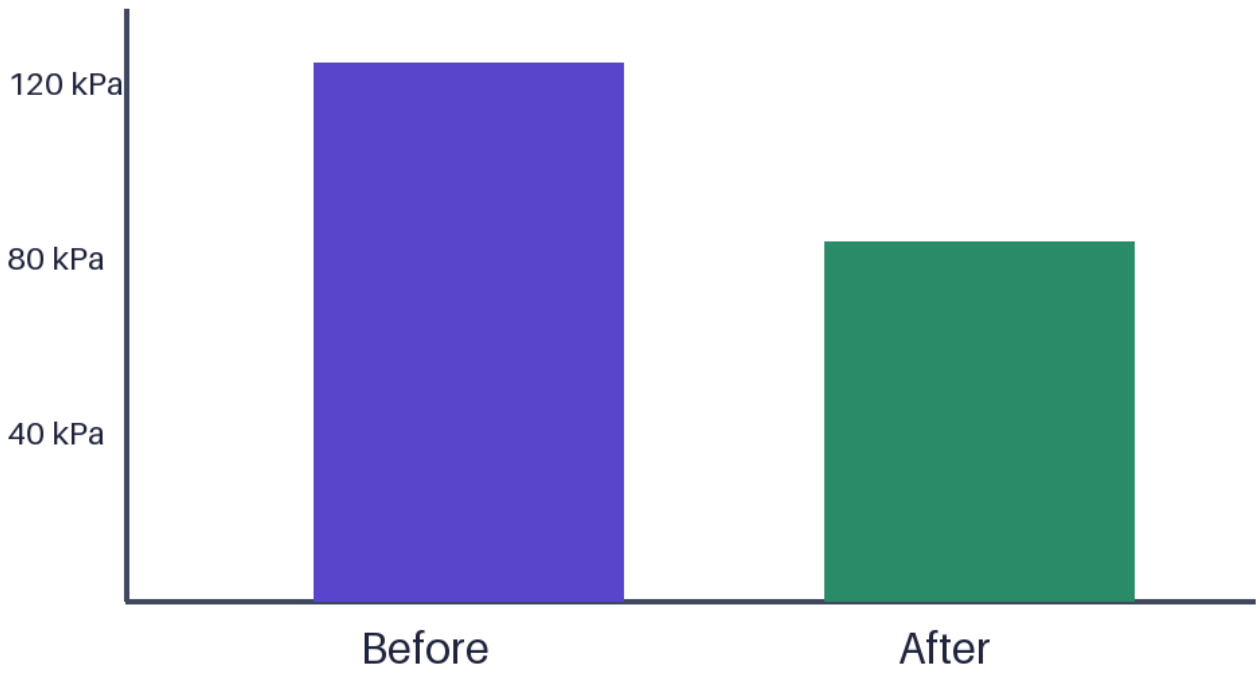

Figure 1. Reactor pressure before and after cooling.

Water circulation system

Water circulation captures water, filters it, then returns it to the tank.
The water circulation diagram shows these three stages in order.

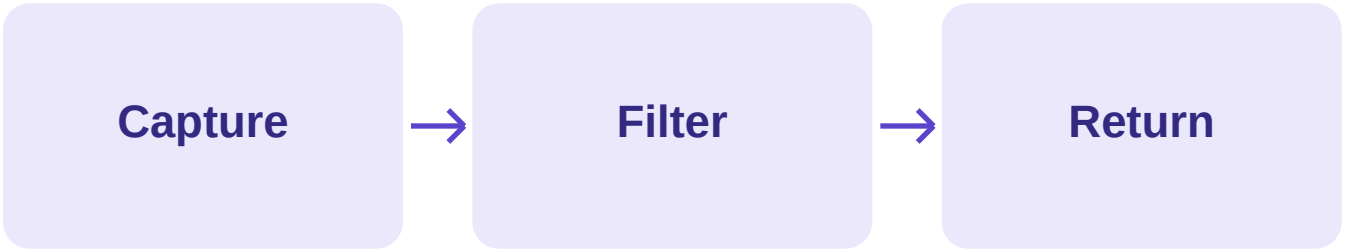

Figure 2. Water circulation through capture, filter and return.

Maintenance notes

These maintenance notes contain no figure.

Inspect the tank weekly and record the condition of the filter.
